LUMBAR EPIDURAL STEROID INJECTION

Where is the epidural space?
There is a fluid-filled sac that covers the spine cord called the dura. The space that surrounds the dura is called the epidural space, and it is filled with fat and small blood vessels. This space runs the entire length of your spine.

What is a lumbar epidural steroid injection?
An epidural steroid injection is a common type of injection that is given to provide relief from certain types of pain. An anti-inflammatory steroid medication and local anesthetic is injected into the space. Since the epidural space runs throughout your spine, medication injected in this area moves freely up and down the spine. The steroid agent shrinks swelling around the nerve roots and the local anesthetic numbs the inflamed areas and relaxes the muscles around the space. To ensure proper placement of the medication, the procedure will be performed under x-ray (fluoroscopy).

What is the purpose of the Lumbar epidural steroid injection?
To treat low back and leg pain that may be due to inflammation of the vertebral disc and/or nerves. However, it will not correct the medical problem causing the inflammation, but may improve the level of pain you are experiencing. It is not unusual to need more than one injection to obtain long term benefit. These injections are done in a series of three, usually a month apart if needed.

What are the risks of the procedure?
Some risks, although remote include: bleeding, infection, nerve injury, and allergic reaction to the medication(s). Diabetics may have short-term elevation of blood sugars. People prone to fluid retention may have increased fluid retention for 1-2 weeks.

What to expect during the procedure:
During the injection, your pain will be increased temporarily. Immediately after the injection, you may feel your legs slightly heavier and they may be numb. You may get 4-6 hours of back pain relief immediately after the injection, however your pain will return and you may have more pain than usual for 5-6 days afterwards.

How is the lumbar epidural steroid injection done?
Upon registering at the Southwest Ohio Pain Center, we will begin your procedure. An IV will be started and you may be given medication for relaxation if you so desire. The area will be cleansed with an anti-septic solution and numbed with anesthetic. The doctor will insert the needle into the lumbar epidural space. The procedure takes about 15-30 minutes.

How much relief will I get & how long will it last?
Relief varies from one person to the next. The only way to know is to have the injection performed. The steroid may take several days to work and peaks in about 2 weeks. Therefore, it may be several weeks before you feel a change in your pain. You may apply ice to the affected area for 20 minutes every 2 hours to decrease local tenderness. After the first day, you can perform activities as before and return to work.

**Will I have any restrictions on the day of the procedure?**
You may NOT drive for the remainder of the day after your procedure. No heat is to be used on the injection area for the remainder of the day. No tub bath or soaking in water (pools/Jacuzzi, etc) for the remainder of the day.

**For what reasons should I call the Southwest Ohio Pain Center after the injection?**
If you experience severe back pain, new numbness or weakness of your legs, loss of control of your bladder or bowels, or have signs of infection (temperature greater than 99.9°, drainage, redness/heat at insertion site) – call IMMEDIATELY.

---

**ON THE DAY OF YOUR PROCEDURE, PLEASE **DO** THE FOLLOWING:**

♦ Take all blood pressure pills & heart medications prior to the procedure with a sip of water at least 3 hours before your requested arrival time. Your vitals must be stable to have the procedure.

♦ Have a responsible person to take you home.

♦ Arrive at the requested procedure time. Please do not be late or your procedure may be cancelled.

**ON THE DAY OF YOUR PROCEDURE:**

♦ **Do not** take ANY of the following 5 days before your procedure: Coumadin

♦ **Do not** take ANY of the following 7 days before your procedure: Plavix

♦ Coumadin must be stopped prior to the injection. You must have a normal INR prior to the injection. **Do not stop the drug by yourself.**

♦ Eat or drink 6 hours before the procedure.

**NOTE: YOUR PROCEDURE WILL BE CANCELLED IF:**

- You have an active infection, flu, cold, fever, or very high blood pressure.
- You do not have a responsible driver to take you home, arrive late for your procedure, or unable to follow the medication / fluid restrictions.
